**Methods and Devices for Controlling Facsimile Transmissions
of Confidential Information**

Cannon 104-93-51

5

ABSTRACT OF THE DISCLOSURE

Confidential information is protected from unauthorized or accidental disclosure by
10 requiring a successful comparison of near end and far end passwords prior to a facsimile
transmission of the confidential information.

BACKGROUND OF THE INVENTION

15 Facsimile ("fax") machines provide the valuable ability to transmit documents quickly
and easily from one location to another. One problem with their current capabilities,
however, relates to the transmission of confidential information. Typically, a person sending
a fax has little control over the document once it is sent. Fax machines are often shared in an
office environment where it is possible, even likely, that parties other than the intended
20 recipient will be able to view the document once it is received. The current state of affairs is
that confidential information, such as employment or business information, which should not
be shared, either is not sent by fax or runs the risk of being disclosed to others if it is sent by
fax.

25 As a partial solution to this problem, there exist fax machines that have the ability to both
receive a fax that contains confidential information and to store an electronic version of the
fax until the recipient enters a password, at which time the electronic version is printed out on
paper. This is only a partial solution, however, because the sending party cannot always
know if the receiving fax machine has sufficient memory to store the confidential
30 information. Additionally, the sending party cannot always know if the receiving fax
machine has adequate security features to prevent access by interlopers. For example, a

machine with adequate security features would limit the number of attempts to enter a password in order to prevent an unauthorized recipient from guessing the correct password. Consequently, if the receiving machine has insufficient or no memory, or if the machine has inadequate or no security features, then the confidential information is vulnerable to disclosure to parties other than the intended recipient.

This "receive and hold" solution has another drawback in that it requires both the sending and receiving machines to be adapted to control access to the confidential information. Even if the sender uses a "receive and hold" near-end machine (i.e., the machine operated by the sender), if the recipient is not equally equipped on the far end (i.e., the position of the recipient's machine), the transmission will not be completed successfully. This solution is, therefore, not universally employable.

It is therefore desirable to provide methods and devices for controlling the facsimile transmission of confidential information.

It is further desirable to control the facsimile transmission of confidential information regardless of whether a far-end fax machine has sufficient memory or security to maintain the confidentiality of transmitted information.

Other desires will become apparent to those skilled in the art from the following description taken in conjunction with the accompanying drawings and claims.

SUMMARY OF THE INVENTION

In accordance with the present invention, there are provided devices and methods for controlling a facsimile transmission of confidential information. A device envisioned by the present invention is adapted to allow transmission of near end, confidential information to a

far end only if a comparison of a near end password with a far end password results in a match. The comparison is conducted at the near end prior to transmission for added security.

Such a device may comprise a facsimile machine, a PC modem, a chipset, digital
5 signal processor or the like. In addition, the present invention envisions combining the above features with the capability of transmitting encrypted or non-encrypted confidential information.

Devices and methods envisioned by the invention may also comprise features and
10 functions used to receive such confidential information as well. For example, the same (or different) device may also generate a notification signal upon receipt of a near end, password request signal or an instruction signal to prompt a far end, intended recipient to enter a password or distribution instructions, respectively.

The present invention and its advantages can be best understood with reference to the
15 drawings, detailed description of the invention, and claims that follow.

BRIEF DESCRIPTION OF THE DRAWINGS

20 FIG. 1 depicts a device for controlling the facsimile transmission of confidential information according to one embodiment of the present invention.

FIG. 2 depicts a device for controlling the facsimile transmission of confidential
information according to another embodiment of the present invention.

25

DETAILED DESCRIPTION OF THE INVENTION

FIG. 1 shows a device 100 adapted to control the facsimile transmission of confidential

information. In an illustrative embodiment of the present invention, device 100 may be part of a larger device, such as a fax machine. That said, the present invention also envisions device 100 as comprising a stand-alone device as well. It should be understood that the devices and other units shown in FIGS. 1 and 2, are just some of the units making up a fax machine or the like.

When shown as separate units, some or all of the units in FIGS. 1 and 2 may be combined into a single unit or device. Likewise, the units may be further broken down into additional units that perform substantially the same functions and operate in substantially the same manner as the separate units. Though referred to as a fax "machine," it should be understood that the device 100 may take the form and shape of any device that transmits confidential information via facsimile, or controls the facsimile transmission of confidential information. In alternative embodiments of the invention, the device 100 may comprise a PC modem/fax board, chipset, digital signal processor, or the like.

One example of how the device 100 operates to control the facsimile transmission of confidential information is as follows.

In an illustrative embodiment of the invention, the device 100 comprises a near-end fax machine. As depicted in FIG. 1, the device 100 comprises comparison unit or means 101 adapted to control the facsimile transmission of confidential information. In one embodiment of the invention, the comparison unit 101 is first adapted to compare a far-end password, received via pathway P_{pw} , against a near-end password stored in the comparison unit 101 or elsewhere within device 100 or within a device connected to device 100. Though referred to as a password, it should be understood that the password may take the form of any signal that can be used to control the transmission of, and access to, confidential information. In alternative embodiments of the invention, the password may commonly comprise a personal identification number (PIN), alpha-numeric characters or the like.

The comparison unit 101 is further adapted to allow the transmission of a facsimile to far end device 200 via pathway F_i , input into or stored within device 100, using means known in the art, only if the comparison above results in a match. Thus, unlike existing devices and methods which transmit facsimiles and then compare passwords at the far end, the present invention completes the comparison at the near end before a facsimile is sent to a far end or intermediate device.

FIG. 1 shows an additional embodiment of the present invention in which the device 100 further comprises encryption unit or means 102. The encryption unit 102 may be adapted to utilize any number of techniques. For example, the encryption unit may be adapted to generate pretty-good-privacy ("PGP")-like, encrypted transmissions which may be decrypted at a far end using public and/or private decryption keys.

Additionally, FIG. 1 shows a device 200, which, for example, may comprise a far end fax machine. As shown, the device 200 comprises decryption unit or means 202 adapted to decrypt confidential information sent via pathway P_e .

FIG. 2 shows a further embodiment of the present invention, in which the far end device 200 further comprises notification unit or means 201. The notification unit 201 is adapted to generate and/or transmit a notification signal along pathway S_N to an intended recipient upon receipt of a password request signal from the near end device via pathway P_R . Though shown as three pathways, it should be understood that P_{PW} , P_r and P_E may comprise any number of pathways, including only one.

The notification signal is intended to be used to notify an intended recipient that communications between the near end fax 100 and far-end fax 200 have begun, and that the near end fax 100 is awaiting the input and transmission of the far end password, P_{pw} . This

spares the recipient the time-consuming experience of waiting by the far end fax 200 for a transmission to begin or end before entering a password.

The exact nature of the notification signal may vary depending upon the needs of the recipient (e.g., how close the recipient is to the fax machine). For example, the notification signal S_N may comprise audible signals intended for one or more recipients, display signals for displaying the identity of one or more intended recipients, or alternatively, may comprise signals compatible with a printer for printing out a cover sheet indicating the names or identifications of one or more intended recipients, to name just a few examples.

In alternative embodiments of the invention, the notification signal S_N may be sent to a recipient via a recipient's local area network (LAN), wireless computing device, electronic mail (e-mail) device, pager, or a voice device. Additionally, the notification signal S_N may comprise any number of communication signals such as an analog signal or a digital signal.

In an additional illustrative embodiment of the present invention, once an intended recipient has input a correct password and once confidential information is received, it may be distributed as follows.

In an illustrative embodiment of the invention, the notification unit 201 is further adapted to generate a "distribution request signal" which it sends to the recipient along pathway S_N . The distribution request signal is intended to prompt an intended recipient to instruct the far end device 200, via signals sent along pathway, S_{DI} , how to distribute the confidential information. The distribution instructions may comprise any number of instructions. For example, the distribution instructions may comprise instructions to transmit the received confidential facsimile information to an output unit. In alternative embodiments of the invention, the output unit may take the form and shape of any device adapted to output the received confidential facsimile information to the recipient. In alternative embodiments of

the invention, the output unit may comprise a far end printer, a LAN, a wireless computing device, or an e-mail device.

As with the pathways between the near end device 100 and far end device 200, the
5 pathways between the far end device 200, that is, S_N and S_{DI} , may be combined into one or further broken down into more than two pathways.

In alternative embodiments of the present invention, some or all of the functions and features of the near end device 100 and the far end device 200 can be combined into one
10 device.

Though the description above has focused on devices, the present invention also envisions methods for controlling the transmission of confidential facsimile information.

15 It is to be understood that changes and variations may be made without departing from the spirit and scope of this invention as defined by the claims that follow.

We Claim:

- 20 1. A device for controlling a facsimile transmission of confidential information comprising:

a comparison unit adapted to allow transmission of confidential information to a far end if a near end comparison of a near end password with a far end password, results in a match.

- 25 2. The device as in claim 1 wherein the device comprises a facsimile machine.

3. The device as in claim 1 wherein the device comprises a PC modem.

4. The device as in claim 1 wherein the device comprises a chipset.

5 5. The device as in claim 1 wherein the device comprises a digital signal processor.

6. The device as in claim 1 further adapted to encrypt the confidential information.

10 7. The device as in claim 6 further adapted to PGP-encrypt the confidential information.

8. The device as in claim 1 further adapted to decrypt confidential information.

15 9. The device as in claim 1 further adapted to generate a notification signal upon receipt of a password request signal.

10. The device as in claim 1 further adapted to generate a distribution request signal to prompt a far end user to enter distribution instructions.

20

11. A device for controlling a facsimile transmission of confidential information comprising:

a notification unit adapted to generate a notification signal upon receipt of a password request signal.

12. The device as in claim 11 wherein the notification unit is further adapted to generate a distribution request signal to prompt a far end user to enter distribution instructions.
13. The device as in claim 11 further adapted to encrypt confidential information.
14. The device as in claim 13 further adapted to PGP-encrypt confidential information
15. The device as in claim 11 further adapted to decrypt confidential information.
16. The device as in claim 11 wherein the device comprises a facsimile machine.
17. The device as in claim 11 wherein the device comprises a PC modem.
18. The device as in claim 11 wherein the device comprises a chipset.
19. The device as in claim 11 wherein the device comprises a digital signal processor.
20. A method for controlling facsimile transmission of confidential information comprising:

comparing a near end password with a far end password at a near end; and

authorizing the transmission of confidential information from the near end to a
far end if the comparison results in a match.

21. The method as in claim 20 further comprising encrypting the confidential information.
22. The method as in claim 21 further comprising PGP-encrypting the confidential information.
23. The method as in claim 20 further comprising decrypting confidential information.
24. The method as in claim 20 further comprising generating a notification signal upon receipt of a password request signal.
25. The method as in claim 20 further comprising generating a distribution request signal to prompt a far end user to enter distribution instructions.

IN THE UNITED STATES
PATENT AND TRADEMARK OFFICE

Declaration and Power of Attorney

As the below named inventors, we hereby declare that:

Our residences, post office addresses and citizenship are as stated below next to our name.

We believe we are the original inventors of the subject matter which is claimed and for which a patent is sought on the invention entitled **Methods and Devices for Controlling Facsimile Transmissions of Confidential Information** the specification of which is attached hereto.

We hereby state that we have reviewed and understand the contents of the above identified specification, including the claims, as amended by an amendment, if any, specifically referred to in this oath or declaration.

We acknowledge the duty to disclose all information known to us which is material to patentability as defined in Title 37, Code of Federal Regulations, 1.56.

We hereby claim foreign priority benefits under Title 35, United States Code, 119 of any foreign application(s) for patent or inventor's certificate listed below and have also identified below any foreign application for patent or inventor's certificate having a filing date before that of the application on which priority is claimed:

None

We hereby claim the benefit under Title 35, United States Code, 120 of any United States application(s) listed below and, insofar as the subject matter of each of the claims of this application is not disclosed in the prior United States application in the manner provided by the first paragraph of Title 35, United States Code, 112, we acknowledge the duty to disclose all information known to me to be material to patentability as defined in Title 37, Code of Federal Regulations, 1.56 which became available between the filing date of the prior application and the national or PCT international filing date of this application:

None

We hereby declare that all statements made herein of our own knowledge are true and that all statements made on information and belief are believed to be true; and further that these statements were made with the knowledge that willful false statements and the like so made are punishable by fine or imprisonment, or both, under Section 1001 of Title 18 of the United States Code and that such willful false statements may jeopardize the validity of the application or any patent issued thereon.

We hereby appoint the following attorney(s) with full power of substitution and revocation, to prosecute said application, to make alterations and amendments therein, to receive the patent, and to transact all business in the Patent and Trademark Office connected therewith:

Thomas J. Bean	(Reg. No. 44528)
